- ✓ minimum size 7 7/8" x 7 7/8"

classic door panels and side panels

interior shutters

embossed bottom panels

EkoGreen internal shutters are commonly used in Europe, especially in the Mediterranean basin, as a solution to

the problem of regulating the amount of light in the interior. They are characteristic primarily of the historic centres of seaside and mountain cities.

They are installed on windows and doors. When opened, they let in the sun, and when closed, they effectively cut off from the outside world, ensuring coolness and privacy.

The use of EkoGreen shutters allows you to improve thermal and acoustic insulation. A wide range of available aesthetic options allows them to be easily matched to rustic and modern interiors. You can use veneers to decorate them, as well as use a two-colour option, i.e. choose a different type of filling on the inside and outside of the shutter.

The maximum size of the shutters is 31 1/2" x 94 1/2", the minimum – 7 7/8" x 7 7/8".
